

EXPERIMENT 26:

QUESTION:

Construct a C program to implement the file management operations.

PROGRAM:

The screenshot shows a C program in a code editor. The program creates a file named 'example.txt', writes data to it, and then reads the data back. The code is as follows:

```
1 #include <stdio.h> :
2
3 int main()
4 {
5     FILE *fp;
6     char data[100];
7
8     // Create and write to the file
9     fp = fopen("example.txt", "w");
10
11     if(fp == NULL)
12     {
13         printf("Error opening file.\n");
14         return 1;
15     }
16
17     fprintf(fp, "Operating Systems Lab\n");
18     fprintf(fp, "File management operations in C.\n");
19
20     fclose(fp);
21
22     printf("File created and data written successfully.\n");
23
24     // Open file for reading
25     fp = fopen("example.txt", "r");
26
27     if(fp == NULL)
28     {
29         printf("Error opening file.\n");
30         return 1;
31     }
32 }
```

The output of the program is displayed on the right side of the editor. It shows the file contents and the program's execution status:

```
File created and data written successfully.
File Contents:
Operating Systems Lab
File management operations in C.
File closed successfully.
...Program finished with exit code 0
Press ENTER to exit console.
```
