

EXPERIMENT 27:

QUESTION:

Develop a C program for simulating the function of ls UNIX Command.

PROGRAM:

The image shows a code editor with a C program that simulates the 'ls' command. The program includes headers for stdio, stdlib, and dirent. It uses opendir to open the current directory, readdir to read directory entries, and printf to display them. The output shows files and directories: a.out, example.txt, sample.txt, and main.c. The program finishes with exit code 0.

```
1 #include <stdio.h> ;
2 #include <stdlib.h>
3 #include <dirent.h>
4
5 int main()
6 {
7     DIR *dir;
8     struct dirent *entry;
9
10    dir = opendir(".");
11
12    if(dir == NULL)
13    {
14        perror("Unable to open directory");
15        return 1;
16    }
17
18    printf("Files and Directories:\n");
19
20    while((entry = readdir(dir)) != NULL)
21    {
22        if(entry->d_name[0] != '.')
23            printf("%s\n", entry->d_name);
24    }
25
26    closedir(dir);
27
28    return 0;
29 }
```

Files and Directories:
a.out
example.txt
sample.txt
main.c

...Program finished with exit code 0
Press ENTER to exit console.
